Product Photos from AI Images

Making attractive product photos for your shop — Free preview

In an online shop a buyer cannot hold the product — the photo is their eyes. A clear, bright, true-to-life photo builds a buyer's trust.

AI image tools now help turn an ordinary phone photo into a professional-looking shop photo: removing the background, fixing the light, adding a new background.

What is it?

This guide shows how to take the photo on your phone, polish it with AI, and make a matching set of photos for your shop.

Remember one rule: however beautiful the photo, never change the product's real colour, size or condition — a misleading photo cheats the buyer, and a cheated buyer never comes back.

How to start — a glimpse

1. Clean the product and place it in daylight, beside a window — not in direct sun.
2. Put it on white paper or a light cloth and take photos with your phone — front, side and from above.
