AI Video Workflow

The full process from idea to finished video — Free preview

Making video is no longer only for professionals. AI tools help at every step — from idea to script, from image to clip, from voiceover to subtitles.

But a good video comes from planning, not from tools. What you will say, who you are saying it to, and how long it will be — once those decisions are made, the rest gets easier.

What is it?

This guide gives the whole workflow: idea, script, visuals, voice, editing, and publishing. It also says what kind of tool helps at each step.

Remember: an AI-made video can have wrong scenes, wrong text or strange faces. Watching the whole video once before publishing is essential.

How to start — a glimpse

1. Decide the video's topic and audience — for example 'an introduction to my shop for new buyers'.
2. Write a short script for 30 seconds or 1 minute; use a chat AI for a draft if needed.
