Using AI Right in Your Child's Studies

Help with homework, but never copying answers — the right rules — Free preview

Today's children are growing up at a time when AI tools are within easy reach. An AI can give a homework answer in a moment — and that is where the danger lies. Copying an answer fills the notebook, but no learning happens. This guide has one core message: AI should help the child learn, never do the learning for them.

AI can be used like a good teacher — explaining a maths rule, giving the meaning of a hard word, or giving advice on a draft essay. But the final answer must always be written by the child, by their own hand, in their own words.

What is it?

This guide gives parents clear rules: how to allow AI use, how to check the answers, and what information must never be given to AI — such as the child's name, school, photo or phone number.

Remember, AI can be wrong. What AI says is not always true. So teach your child — read AI's answer, understand it, check it against the book, and if something is unclear, ask a parent or a teacher.

How to start — a glimpse

1. First explain to your child: AI is a helper, not an answer-writing machine — the child writes the answer.
2. Sit together and ask AI one simple question — for example the meaning of a word — and check the answer against the book.
