Excel & Google Sheets in Real Work

Shop, office and study records — with formulas — Free preview

Excel and Google Sheets are the same kind of record book — Excel runs on your computer, while Google Sheets runs in a browser and can be shared online. Shop sales, office lists, or study marks can all be kept in a sheet.

The key to learning sheets is formulas. Every formula starts with the = sign. For example, =SUM(B2:B20) adds up all the numbers in a column. Once a formula is in place, the total updates itself when you add new numbers.

What is it?

This guide is not just a list of formulas — it uses real examples like shop stock, monthly expenses, and exam marks to show when to use each formula.

Most formulas work the same in Excel and Google Sheets. XLOOKUP is available in newer Excel (Microsoft 365 and Excel 2021 or later) and in Google Sheets; in older Excel, use VLOOKUP or INDEX-MATCH instead.

How to start — a glimpse

1. First fix the structure of the sheet — write headings at the top, for example Date, Product Name, Quantity, Price, Total.
2. Keep only numbers in number columns — do not write the word for the currency inside the same cell as the amount, or adding will break.
